

Identity and Access Management

The need for organisations to manage digital identity for individuals, trusted parties, and trusted objects is pushing traditional Enterprise Identity and Access Management (IAM) systems to their limits.

As Enterprises and their workforce adapt to mobile and Cloud-based frameworks, IAM solutions must be increasingly flexible as well as meeting stringent security requirements.

Organisations must find a way to solve the challenges that data, identity, and the demand for mobile working bring.

We have vast experience in the following solutions, including custom development:

The key is to ensure that the business remains safe, while ensuring the right people have access to the right things and for the right reasons!

The challenge for organisations is to enable ease of user access while ensuring the security of their business data and assets.

Quorum have almost 20 years' experience of Enterprise IAM environments and are pioneers of Cloud-based technologies.

We have a fundamental understanding of both the processes required, best practices, and technological solutions for IAM.

Why Choose Quorum?

We have a permanent staff of solution architects, infrastructure architects, cloud architects and identity architects

We have a deep knowledge and understanding of how to operate effectively in highly governed and regulated industries.

We take a Cloud first approach and our team expertise in Microsoft Azure and Amazon Web Services solutions.

We are a Managed Services provider and have an established App Dev and support function that can be drawn upon.

No matter how smart the technology solution we never forget the human factors of a system.

We work closely with integrators and operators to look at process, best practice and support needs to allow for best performance of both human resources and technology.
